The present sequence is the human immunoglobulin superfamily protein IGPAM-9. Its gene was isolated from a cDNA library of breast tumour tissue. It is expressed in reproductive, gastrointestinal and immune and anematopoletic tissue, where cancer and inflammation are common. The gene, protein, its antibodies, agonists and antagonists are suitable for disgnosing and treating many diseases, including cancer, immune system at arteriosclerosis, asthma, atherosclerosis, cholecystitis, Crohn's arteriosclerosis, asthma, atherosclerosis, cholecystitis, Crohn's disease, diabetes mellitus, emphysema, Graves' disease, hepatitis, multiple sclerosis, psoriasis, rheumatoid arthritis, scleroderma, systemic lupus erythematosus and ulcerative colitis, complications of cancer, haemodialysis and extracorporeal circulation, trauma and cancer (such as leukaemia) and infections caused by
                                                                                                                                                                                                                                                                                                                                      Immunoglobulin superfamily proteins, the agonist and antagonist of th protein is useful for preventing and treating disorders associated wi altered levels of the protein such as cancer, immune system disorders

The MAb is of subclass IgG4 and binds to lymphokines/monokines with an affinity of 10(9)/M. The Mab or fragment (Fv, single-chain Fv, Fab or F(ab') 2) is used in the treatment of inflammation e.g. rheumatoid arthritis, osteoarthritis and inflammatory bowel diseases, and in the treatment of psoriasis, allergy, septic shock, graft vs host disease and tumours. The MAb or fragment can also be used for

by the cDNA isolated as clone 1666486 from the Incyte BMARNOTO3 library. The human IMOLB (AAB15336-B15550) and their encoding polynucleotides (AAA95775-A95789), and compositions comprising them are useful for the control of infections and cell proliferative disorders, including cancer. The IMOL may be used to treat or prevent disorders, including cancer. The IMOL cexpression or activity of IMOL, such as immunological disorders. CC (e.g. inflammation, actinic keratosis, AIDS, Addison's disease), coronavirus, coronavirus), bacteria (e.g. Staphylococcus, Streptococcus, Streptococcus, Irreptococcus, Irreptococcus, CC Shigella), fungi (e.g. Aspergillus, Blastomyces), parasites (e.g. CC glasmodium, Trypanosoma, intestinal protozoa), cell proliferative cuseful as immunogens for the development of antibodies that specifically recognizes these peptides. The polynucleotides may be used to detect and quantify gene expression in biopsied tissues in which compounds in drug screening techniques. Antibodies which specifically compounds in drug screening techniques. Antibodies which specifically be used for the disease, as targets in a carrier and affected individuals, and for screening libraries of by expression of IMOL may be used for the disgnosis of disorders characterized by expression of IMOL, or in assays to monitor patients being treated XX with IMOL or agonists, antagonists, or inhibitors of two-

S09711
Ig heavy chain V region - human
C;Species: Homo sapiens (man)
C;Date: 21-Nov-1993 #sequence_revision 10-Nov-1995 #text_change 1:
C;Accession: S09711
R;Hughes-Jones, N.C.; Bye, J.M.; Beale, D.; Coadwell, J.
Biochem. J. 269, 135-140, 1990
A;Title: Nucleotide sequences and three-dimensional modelling of A;Reference number: S09710; MUID:90262535; PMID:2111699
A;Accession: S09711
A;Status: preliminary
A;Molecule type: mRNA
A;Residues: 1-146 <HUGs
C;Superfamily: immunoglobulin V region; immunoglobulin homology
C;Keywords: heterotetramer; immunoglobulin
F;34-118/Domain: immunoglobulin homology <IMMs
